DETAILED ACTION

EXAMINER'S AMENDMENT

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it **MUST** be submitted no later than the payment of the issue fee.

The application has been amended as follows:

Claim 1: on line 8 replace the phrase "a electronic circuit" with --an electronic circuit--.

Allowable Subject Matter

Claims 5-7 are allowed.

The following is an examiner's statement of reasons for allowance:

With regards to the independent claim 5 as amended, the prior art of record does not teach the splitting of a signal generated by a piezoelectric measuring element into two components, an evaluation signal comprising high frequency components (above a threshold level) and a supply signal comprising low frequency components (below the threshold). The Schoess reference teaches a splitting of the measurement signal into two components, however, the signal is first amplified and thus fails to teach the limitation of amplifying *only* the evaluation signal *after* it has been filtered. This allows the supply signal to remain in its original form for providing power to the circuit. The

Art Unit: 2856

Yanagi reference teaches splitting a signal from a piezo element into two portions, one of high frequency and one of low frequency, however the high frequency component is used as a gate control signal for a gate circuit in which the output signal comprises only the low (supply) signal, and none of the high (evaluation) frequency components for indicating vibration. The Russell reference also fails to teach the splitting of a signal into two separate components, one suitable for providing power to the system and amplifying only the other for analysis. As the amplification of the evaluation signal plays a role in the detection of fault-related noise, its addition to the system is necessary for the functionality of the system as a whole. Further, it is noted that the threshold value of the system as described in the specification is equal to the normal operating noise in the system (i.e. 50 kHz) such that any fault-related noise in the system which occurs above that threshold value will be filtered out for transmission to an evaluation device. The prior art, alone or in combination fails to teach or provide the motivation to arrange or operate a sensing unit in the manner claimed.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
